The Game Design Document (GDD) is where the planning for a video game is done. This gives it a more structured development process and better guides the planning, programming, and creation of elements within the game. This ensures that everyone working on the project (programmers, artists, designers, etc.) has a general idea of what other applications and their colleagues will be doing.

The GDD is not static and can evolve as development progresses and ideas are revised as new ideas emerge or technical limitations arise. It must also define a "gameplay loop," which is what the player will have to do. This can be based on the story, the characters, and the game's artwork.

It is also important to emphasize that this document details the rules of the game. This isn't just about in-game movement, but also about the mechanics, menus, and screen selection, as well as preventing the addition of unnecessary features, thus simplifying the team's work.

Within the team, the sections that a GDD (Game Design Team) typically focuses on are the following:

1. Game Mechanics: How the game's controls and systems work technically

2. Architecture: What the game's tools, scripts, and assets are like
3. UI: How menu navigation and the HUD (Head-Up Display) work on the player's screen
4. Level Design: How the game's levels or challenges will be logically structured and supported
